

# Reference Cities for Use by Severe Weather Spotters

All weather reports relayed to NWS meteorologists at the Milwaukee/Sullivan Weather Forecast Office by trained weather spotters must utilize the following standards to describe the location of the observed weather phenomena:

## **Distance and compass direction from the nearest city/village known as a reference city.**

Distance is regarded as distance to the nearest one tenth of a mile (0.1 mile) from the recognized center of a city/village (not the edge or limits of the city/village). This may be an intersection of major roads that may be considered the center, or a cluster of administrative buildings.

We require this format because radar information (pathcasts) in NWS warnings and associated follow-up statements is based on distance from the geographic center of cities/villages. In addition, post-storm information written in Local Storm Reports (LSR's) sent to all media outlets, and the *Storm Data* publication use this notation.

Cities and villages that can be used are typically found on a standard State of Wisconsin road map, and location details depicting those cities and villages are provided in this document. The event location should also be referenced with one of the 16 compass points (N, NNE, NE, ENE, E, ESE, SE, SSE, S, SSW, SW, WSW, NW, and NNW). Of course, the county from which the report is originating from is required, because some cities overlap two county lines.

### Examples:

- 2.2 E Jefferson, Jefferson Co.
- 2.4 NE Waupun, Fond du Lac Co.
- 0.5 E Cobb, Iowa Co.
- 3.7 S Mitchell Field, Milwaukee Co.
- 5.5 WSW Madison, Dane Co.

However, for some cities such as Milwaukee, the political/cultural center has been defined as the center of that city. In some cases, the geo-political center may be the intersection of two main roads, or the village/city square/courthouse, or where the city hall and administrative buildings are found (the political/cultural center.) The references indicated below eliminate any ambiguities associated with the potential of more than one spotter using more than one location for a given reference point.

**Note:** Spotters are to determine their reference point using the provided lat/long data pair as the first option, and the given written intersection for that reference point as the second option using the information provided in the following pages. For many reference cities, the lat/long location will not be exactly the same as the intersection location, however these two locations should be fairly close.
